

Forge

A local research fleet for scientific models and governed data

An invitation to Bob: shape the science, validation, and
collaboration.

A working cross-machine spine

The native Mac fleet view, bounded node actions, local inference, and receipts are inspectable today.

Boundary Agent heartbeats do not verify a finished Linux desktop or remote screen control.

Treasure Valley: the whole story

Seven scenes on the private 4090 simulator connect time, water, energy, uncertainty, and evidence.

FULL LOCAL PRESENTATION

7 scenes • on this Mac / LAN

Current outputs are prototype / screening material, not calibrated operational forecasts.

Real observations, clear boundaries

Pal's new package holds separate provider extracts; older synthetic series are labeled separately.

OFFLINE LAKE MANIFEST

80 tables · 25,725 listed rows · 11 integrity drifts

These extracts are provider sourced; the AI-to-table route and full model integration are not yet verified.

From observed data to validated uncertainty

A tractable research plan is to connect governed observations, physical models, and uncertainty analysis.

What is actually checked

A local NumPy risk sample: 1,000 draws → 10 rows. It does not invoke INL RAVEN.

Build a research question together

Use the existing Idaho energy-water program as context for a separate proposal conversation.

FUNDED CONTEXT

NSF I-CREWS

Award OIA-2242769

Mitch Meads leads the Treasure Valley site

PROPOSED NEXT STEP

A new NSF direction

Invite Bob to shape the science, validation partner, and division of work with Mitch.

Mechanism and roles are open. EAGER is one possible exploratory path, subject to NSF program-officer concurrence.

Bob, would you help us shape the next research step?

- 01 What is the strongest scientific question?
- 02 What validation would make the result credible?
- 03 Which collaborators and funding path fit the work?
